ÄÄ
A NAPPA Profile on ITT, written by Blind Justice.

ITT is International Telephone and Telegraph. They speacialize in Telix type
formats similar to the ones I discussed in my Telecom phile.

Itt's connections aren't particularly terrific for data transmissions.
Phreaks have complained of excessive line loss over relatively short
distances. The company's strong point is and will continue to be their telix
activities.

The code format for this service is different. In an obvious attempt to deter
phreaking, they've departed from the usual node arrangement, node, area code
and number, then the code. From a practical point of view there is little
difference. From an operational viewpoint the phreak must chain together his
dialing string instead of using just one. I others words, instead of punching
one macro to output his call, two are required. The coding uses a prefix and
suffix as area qualifiers. The first two digits of the code refer to the area
of the country the code has been assigned. Consequently, most phreaks prefer
to use the prefix in their hack attempts. The object is, of course, to improve
effieciency.

Itt is expanding it's overseas network and is offering services
to Singapore as well as the regular European countries.
