Predatory nematodes are microscopic critters that travel through liquid mediums to kill and multiply in bad garden bugs, like skeeter larvae, fleas, ticks, grasshoppers, chafer beetles...etc... I get mine from www.gardensalive.com www.natpestco.com www.buglogical.com Whichever has the best price when I need them. They come in a sponge filled with liquid and nematodes. You soak the sponge in water and then use that water to either water afflicted areas or inject into plants. The nematodes travel through the moist ground or through the sap in the plants to seek out prey and kill them dead. Wonderful little buggies...

Anybody want me to sing my ode to nematodes? LOL
